

# VCS Canvas Page Orientation

[Contents](#) [Previous](#) [Next](#)

**Goal:** To introduce you to VCS Canvas page orientation (i.e., Landscape or Portrait)

Reselect the "clt" Variable in the "Variable" selection window. This will reinitialize the "Dimension Manipulation Panel". Select the orange "Plot" button to display the "clt" data set.

The VCS Canvas display can be in either one of the two orientations: "Landscape" (default orientation) or "Portrait".

To specify the canvas orientation, depress the "Option" menu to the right of "VCS Canvas 1". Then move the pointer over "Page Orientation" and select either "Landscape" or "Portrait". Select the plot button to see the orientation change. Note, if something is plotted on the VCS Canvas, then it will be cleared and automatically replotted.

For our example, select the "Portrait" menu item. The plot will automatically be redisplayed. See figure 13 for the portrait display. Repeat the process and select the "Landscape" menu item. See figure 12 for the landscape display.

Figure 12. Landscape display results.

Figure 13. Portrait display results.
